

Web Based Software:

Mesa's new ViewPoint Continuous Monitoring Software (CMS) is everything you have been waiting for, incorporating innovative design with user-friendly features to make continuous monitoring easier than ever before. ViewPoint Software is as effective as it is user-friendly. The interface allows you to view all of your assets on one or several floor plans with visual representation of your assets as well as the ability to view your inputs in a tile or list view.

ViewPoint CMS is available as a web-based software, offering advanced versatility and can even be used remotely. There are various benefits to a web-based software monitoring system, such as:

- Ability to access the software anywhere, at any time as long as you are connected to the internet on a networked device.
- The url can be publicized to allow for access from an off-network device.
- No need to replace PC systems or install/reinstall a client.
- There is no cost to add seats to your system, you can add as many users as you see fit.
- The system can be accessed through a secure connection outside of your network, and can even be shut down externally. There is no need for VP or a Citrix-type portal.
- You have the ability to set your own security parameters.
- There is no need for an onsite server or server room. The application can be hosted locally, virtually, or on the cloud.
- Works across all modern browsers, utilizing a more robust MicroSoft sequel database.
- The administrator can configure everything from the number of attempts to login before a lock out happens to automatic logouts due to inactivity.

A few of the biggest benefits of using a web-based monitoring system are the overall cost, convenience of accessibility, and the availability.
